Dan,

Here are the results we are experiencing with the Poly Slick grease we began using in May of 2002. We use Poly Slick on our whole corrugator, including the langston single facer corrugator including C-Flute and B-Flute machines.

We are using the Poly Slick grease on all applications where we have hot bearings and in the pre-conditioner where steam is used. The pre-conditioner transfers heat to the paper to make our final product corrugated paper. The cylinder temperatures range from 350 to 375 degrees Fahrenheit. The loaded cylinders carry a maximum of 3500 PSI. The air cylinder inlet pressures that load the corrugated rolls and pressure rolls are between 60-85 PSI. We grease the bearings 2 times a week.

In September we had scheduled down time to completely tear down the corrugator machine and do a through inspection. We had no bearing failures in the previous 6 months. Upon further inspection of the bearings we found no visible signs of wear.

We are completely satisfied with the quality of Poly Slick and your outstanding service.

Sincerely,

A handwritten signature in cursive script that reads "Tom Jones".
